Title:

INCREASING THE ENERGY AND INFORMATION STORAGE EFFECTS OF A HOMEOPATHIC
(Effects of a Patented Process on Water's Electrical Retention)

Author:

Noelle White, Technician

New Vistas, Inc.; Denver, Colorado

This study was performed in 1994 in Denver, Colorado; U.S.A.
Abstract:

In this short discussion we compare the homeopathic patented process of the Maitreya Corporation of Limerick, Ireland and its ability to produce water capable of storing electrical energy for a longer period of time, versus the control factor: water which is normally used for homeopathics.

In this study a classical homeopathic known as Podophyllum was manufactured. The final homeopathic was then subjected to an electrical signal of 100 volts DC and 50 milliamps. This normally produces a separation of the hydroxyl and hydrogen ions in a water source and creates an electro potential within the water which can be measured.

We then compared the ability to store energy of the homeopathic made with patented water versus the normal water. Our results will show that there is a dramatic superiority in the patented water to maintain the zeta effect, or the electrical energy.

Key Words:

Podophyllum homeopathic, water, effect, energy
Introduction:

It has long been known that water is not a conductor of electrical material unless there are other ingredients in it. As we put various ingredients into it we affect the water and its ability to conduct and to hold a charge. If we apply voltage and amperage across water containing an item, there may be electrical storage in the hydroxyl and hydrogen ions as they separate. Thus water can act as a small battery. This is due to the van der Waal's effect and the zeta effect of water. In our polymorphic structure theory, increasing the zeta effect would likely increase the polymorphic structure-forming capacities.

Hypothesis:

We hypothesize in this study that the homeopathic patented water developed by the Maitreya Corporation would have a superior ability to hold the electrical charge over a period of time. This also would help to explain the higher degree of information retention in a homeopathic that is made by this patented process.

Methods:

For this short study we chose Podophyllum as an herb that was blended into a homeopathic. This was done at low potencies of the 2c, 2x, 6x, and 7x percentage. Then in a one-ounce bottle we apply for twenty minutes a DC current of 100 volts and 50 milliamps. Upon termination we then, every six minutes over an hour, measure the electrical potential maintained in the water.

Our normal profile of water should be able to initially have an excess amount of the electrical energy, which will build slowly over the course of time. Then, upon reaching a peak, it will slowly discharge, create even a negative potential, and then roughly stabilize within approximately one hour.

Results:

We have seen in the homeopathics made with the traditional (normal) water and alcohol that they follow a normal type of pattern; one which shows an acceleration of the electrical energy of the water over a period of time. After this dissipates the homeopathic will lose its energy, sometimes even create a negative potential, and then roughly stabilize within an hour. This is seen in diagrams #1 - #5 in the values of the normal water.

When the homeopathic was made with the electrically-activated water, however, there is a remarkable difference. Here there is not only a greater energy surge, but we will see that the energy surge does not dissipate down to zero. The homeopathic, even over a twenty-four hour period, is able to hold its electrical energy much longer. In fact, we have found that this electrical energy doesn't dissipate, even after weeks.
Thus the homeopathic patented water seems to have a greater ability to maintain electrical storage. It can be hypothesized from this study for further investigation that the patented water process would thus yield a greater homeopathic that can have more potential uses in homeopathic action or in medicine.

We have seen from the study done within the patent [Patents: 1] that there is a dramatic increase in the clinical effects of the patented water. In studies done on the water by Olga Zhalkl-Titarenko [Studies: 2, 3] we also found that there is an increased proton bonding energy within the patented water as well. Also we have shown that there is an increase in the penta, or five-part, collection of water in the patented water.

All these factors lead us to conclude that the homeopathic patented water has an increased effect of homeopathic action, and works better than the normal control.
