SINthetic pesticides cause Autism, not Vaccines

SINthetic pesticides cause Autism, not Vaccines

Immunization was used in India 1000 BC
In China it was used from 1350 AD

(Almost 3000 years of vaccination without Autism)

In 1796 Jenner makes Vaccination very popular to the people,
Louis Pasteur makes many vaccines
The need for Vaccine regulation is behind the development of the FDA

First Synthetic chemicals made in 1869.
Use of SINthetically Derived Pesticides starts in 1900. Use Expands in 1909.
The first legislation providing federal authority for regulating pesticides was enacted in 1910.

(One Year)

Autism is first observed in 1900s and it is labeled Autism in 1911, near to the first use of the SINthetic Insectides, just one year after the first use of the manmade chemicals

Autism grows in perfect correlation to the use of SINthetic Chemicals World-Wide. The Causative relation of SINthetics causing Autism is absolutely confirmed
SINthetic pesticides cause Autism, not Vaccines

The tradition of inoculation may have originated in India in 1000 BC. The mention of inoculation in the Sact'eya Grantham, an Ayurvedic text, was noted by the French scholar Henri Marie Husson in the journal Dictionnaire des sciences médicales.

Inoculation was reportedly widely practiced in China in the reign of the Longqing Emperor (r. 1567–1572) during the Ming Dynasty (1368–1644).

The Anatolian Ottoman Turks knew about methods of inoculation. This kind of inoculation and other forms of variolation were introduced into England by Lady Montagu, a famous English letter-writer and wife of the English ambassador at Istanbul between 1716 and 1718, who almost died from smallpox as a young adult and was physically scarred from it.

Inoculation was adopted both in England and in America nearly half a century before Jenner's famous smallpox vaccine of 1796.

Since the beginning of vaccination over 1000 years pass without autism.

From when more modern vaccinations from Jenner appear over 100 years pass without autism.

First SINthetic drug is developed in 1869.

There is an explosion of SINthetic chemicals and toxins flooding our environment from the chemical companies from 1895. The first active SINthetic rotenone chemical component was first SINthetically isolated in 1895 by a Swiss-French botanist, Emmanuel Geoffroy, who called it nicouline. In 1902 Japanese chemist Nagai Nagayoshi isolated a pure SINthetically extracted crystalline compound from Derris elliptica which he called rotenone, after the Japanese name of the plant, roten. Later, nicouline and rotenone were established to be chemically the same.

The first legislation providing federal authority for regulating commercial pesticides was severely needed to protect people and was enacted in 1910.

Decades later during the 1940s manufacturers began to produce large amounts of synthetic pesticides and their use became widespread. Some sources consider the 1940s and 1950s to have been the start of the "pesticide era." Although the U.S. Environmental Protection Agency was established in 1970 and amendments to the pesticide law in 1972, pesticide use has increased 50-fold since 1950 and 2.3 million tonnes (2.5 million short tons) of industrial pesticides are now used each year. Seventy-five percent of all pesticides in the world are used in developed countries, but use in developing countries is increasing. A study of USA pesticide
SINthetic pesticides cause Autism, not Vaccines

use trends through 1997 was published in 2003 by the National Science Foundation’s Center for Integrated Pest Management.

Autism is seen in the early 1900s and the first use of the word autism is Eugen Bleuler, a Swiss psychiatrist, was the first person to use the term. He started using it around 1911.

SINthetic insecticides are first developed and used in Switzerland and one year after their use a Swiss Doctor discovers Autism. Autism is a very rare disorder at this time.

Eugen Bleuler the Swiss doctor who first used the word autism, said that this particular disease pattern differed from any other disease he had seen, the old term Schizophrenia did not cover this new disease which had children being more to themselves than before so the Greek word autos for self he developed into autism because the patient was extraordinarily internal focused.

As the SINthetic chemicals and most specifically the use of SINthetic insecticides grows, Autism grows right along with it. The correlation is extreme.

**Autism History**

The term autism first was used by Swiss French psychiatrist Eugen Bleuler in 1908. He used it to describe a schizophrenic patient who had withdrawn into his own world. The Greek word "autós" meant self and the word “autism” was used by Bleuler to mean morbid self-admiration and withdrawal within self. America will bring the new SINthetic farm products into commerce and then as it increases use the rate of autism increase and by 1940 it has become very evident, the explosion of farm chemicals thru the 1970 will drive autism to frenzy and as the SINthetic farm products increase Autism increase directly. The pioneers in research into autism were Hans Asperger and Leo Kanner. They were working separately in the 1940’s. Asperger described very able children while Kanner described children who were severely affected. Their views remained useful for physicians for the next three decades.

**Chronological history of autism correlates to SINthetic Chemicals**

- Eugen Bleuler coined the word "autism" in 1908 among severely withdrawn schizophrenic patients.
- In 1943 American child psychiatrist Leo Kanner studied 11 children. The children had features of difficulties in social interactions, difficulty in adapting to changes in routines, good memory, sensitivity to stimuli (especially sound), resistance and allergies to food, good intellectual potential, echolalia or propensity to repeat words of the speaker and difficulties in spontaneous activity.
- In 1944 Hans Asperger, working separately, studied a group of children. His children also resembled Kanner’s descriptions. The children he studied, however, did not have echolalia as a linguistic problem but spoke like grownups. He also mentioned that many
of the children were clumsy and different from normal children in terms of fine motor skills.

- Next Bruno Bettelheim studied the effect of three therapy sessions with children who he called autistic. He claimed that the problem in the children was due to coldness of their mothers. He separated the children from their parents. Kanner and Bettelheim both worked towards making hypothesis that showed autistic children had frigid mothers.

- Bernard Rimland was a psychologist and parent of a child with autism. He disagreed with Bettelheim. He did not agree that the cause of his son’s autism was due to either his or his wife’s parenting skills. In 1964, Bernard Rimland published, *Infantile Autism: The Syndrome and its Implications for a Neural Theory of Behavior*.

- Autism came to be better known in the 1970’s. The Erica Foundation started education and therapy for psychotic children in the beginning of the 80s. Many parents still confused autism with mental retardation and psychosis.

- It was in 1980’s that Asperger’s work was translated to English and published and came into knowledge.

- It was in the 1980’s that research on autism gained momentum. It was increasingly believed that parenting had no role in causation of autism and there were neurological disturbances and other genetic ailments like tuberous sclerosis, metabolic disturbances like PKU or chromosomal abnormalities like fragile X syndrome.

- Lorna Wing, along with Christopher Gillberg at BNK (Children’s Neuro-Psychiatric Clinic) in Sweden in the 1980’s found the Wing’s triad of disturbed mutual contact, disturbed mutual communication and limited imagination. In the 1990’s they added another factor making it a square. The factor was limited planning ability.

- Ole Ivar Lovaas studied and furthered behavioural analysis and treatment of children with autism. Lovaas achieved limited success at first with his experimental behaviour analysis. He developed it to target younger children (less than 5 years of age) and implemented treatment at home and increased the intensity (a measurement of the amount of “therapy time”) to about 40 hours weekly. Lovaas wrote *Teaching Developmentally Disabled Children: The Me Book* in 1981. In 2002, Lovaas wrote *Teaching Individuals With Developmental Delays: Basic Intervention Techniques*.

There is published research on these therapies, and the new world of energetic medicine can help even the most problematic cases.

It is a scientific fact that when a low level voltage is applied to the body and micro-current pulses are generated and feeding are increased, the body’s electric, energetic, and metabolic activity is increased. The SCIO will let the patient’s body electric current level be raised, helping to normalize brain function and improve health.

The SCIO has been shown to help autism, attention deficit and hyperactivity disorder, children and adults, helping to treat of many issues, such as anxiety, depression, emotional dysfunctions, and insomnia.
SINthetic pesticides cause Autism, not Vaccines

Parts of the Brain Affected by Autism

Cerebral Cortex:
A thin layer of gray matter on the surface of the cerebral hemispheres, two thirds of this area is deep in the tissues and folds, this area of the brain is responsible for higher mental functions, general movement, perception and behavior reactions.

Basal Ganglia:
This is gray masses deep within the cerebral hemisphere that connects the cerebrum and the cerebellum, it helps regulate automatic movement.

Corpus Callosum:
This consists of closely packed bundles of fibers that connect the right and left hemispheres of the brain and allows them to communicate with one another.

Amygdala:
This is responsible for all emotional responses including aggressive behavior.

Hippocampus:
This makes it possible to remember new information and recent events.

Brain Stem:
The Brain Stem is located in front of the cerebellum and serves as a relay station, passing messages between various parts of the body and the cerebral cortex. It controls the primitive functions of the body essential to survival including breathing and heart rate.

Cerebellum:
This is located at the back of the brain, it fine tunes motor activity, regulates balance, body movements, coordination and the muscles used for speaking.

Glyphosate and Autism*

"If you know nothing about Statistics, let me tell you this type of EXTREME Correlation is just about Proof of the Cause of Autism being Glyphosate+ other SINthetic items"

Pearson Correlation Coefficient = 0.985

The rise of GMO foods has resulted in the increasing use of Glyphosate herbicides. When this data is overlapped with autism prevalence rates the correlation is astonishing. To see more of Nancy’s statistical analysis, access her full report as archived on Dr. Stephanie Seneff’s MIT page
